

UK Renal Registry 18th Annual Report: Appendix H Coding: Ethnicity, EDTA Primary Renal Diagnoses, EDTA Causes of Death

H1: Ethnicity coding

In some renal centres ethnicity data is recorded in the clinical information systems in the individual renal centres in the format of 9S... read codes. In other centres it is extracted from local PAS systems in a different format and should be recoded to the 9S... format by the centre, before being sent to the UK Renal Registry (UKRR). For report analyses, ethnic categories are condensed into five groups (White, South Asian, Black, Chinese and Other). For some analyses Chinese are grouped into Other.

H2: EDTA primary renal diagnoses

New primary renal diagnosis codes (PRD) were produced in 2012 [1]. The data used for this report included a mixture of old and new ERA-EDTA codes. The split was about 50:50 for 2014 incident patients. For those people without an old code, new codes (where available) were mapped back to old codes using the mapping available on the ERA-EDTA website. As recommended in the notes for users in the ERA-EDTA's PRD code list document the mapping of new to old codes is provided for guidance only and has not been validated; therefore care must be taken not to over interpret data from this mapping.

The old codes (both those received from centres and those mapped back from new codes) were then grouped into the same eight categories as in previous reports as shown in the table below.
